## Heating Bills Surge Across Georgia

February 10, 2010

Associated Press

Georgia Power says it's dealing with an avalanche of customer calls after a colder than usual January left many Georgians with higher bills.

Georgia Power spokesman Jeff Wilson says the average temperature for January was 39.5 degrees, about six degrees lower than average.

The utility estimates it was the coldest January in Georgia since 1985 and it left Georgia Power customers using 23 percent more electricity compared to a year ago.

Early February temperatures have been closer to normal, but Wilson pointed out that cold weather is moving in again. It's unclear whether Georgia Power customers are in for another month of super-high bills because of the cold weather.

"The more expensive energy becomes and the bigger a home is, the more savings potential one has."

There is no doubt an increasing interest in building, creating & maintaining more efficient homes and buildings of all kinds. We can all have just about anything in this world, if we can somehow find a way to give enough others what they want and that's one of the primary purposes of Adding Value.

Adding Value works to enhance market value, processes and profitability by increasing the appeal, function and marketability of homes & properties with quality building products and service. Adding Value aims to be the multi-product source for the most desired, high quality specialty, finishes & upgrade products with uncompromisable service that Builders, Designers, Re-sellers, Agents & Homeowners look to first.
